

**Mass spectrometry of  
proteins, peptides and other  
analytes: principles and  
principal methods**

**Matt Renfrow**

**January 8, 2010**

# Objectives of the Lecture

1. Make ions
2. Separate/Analyze/Detect ions
3. What is mass resolution and mass accuracy?

## ***What does a mass spectrometer do?***

1. It measures mass better than any other technique.
2. It can give information about chemical structures.

---

## ***What are mass measurements good for?***

To identify, verify, and quantitate: metabolites, recombinant proteins, proteins isolated from natural sources, oligonucleotides, drug candidates, peptides, synthetic organic chemicals, polymers

# Applications of Mass Spectrometry

## Pharmaceutical analysis

Bioavailability studies

Drug metabolism studies, pharmacokinetics

Characterization of potential drugs

Drug degradation product analysis

---

Screening of drug candidates

Identifying drug targets

## Biomolecule characterization

Proteins and peptides

Oligonucleotides

## Environmental analysis

Pesticides on foods

Soil and groundwater contamination

## Forensic analysis/clinical

(Ions are easier to detect than neutral molecules.)

## Electrospray ionization:

# Electrospray Ionization (ESI)

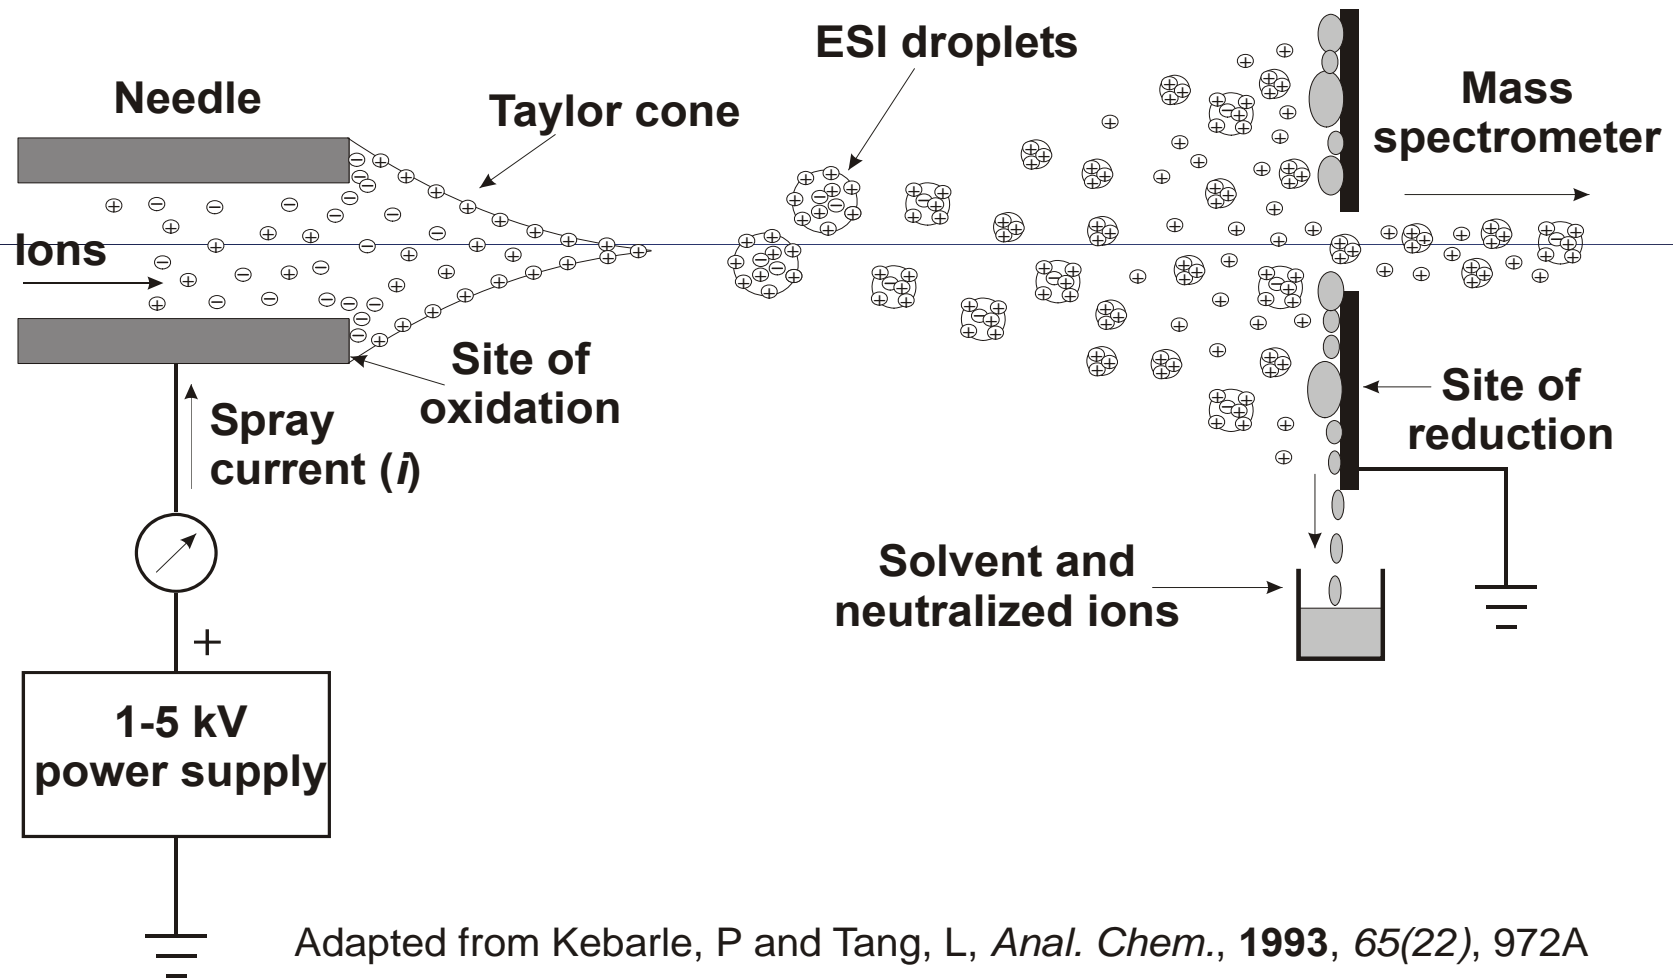

1. Solvent evaporation
2. Coulombic repulsion

# Electrospray Ionization (ESI)

# Electrospray Ionization (ESI) Process (Positive Mode)

Adapted from Kebarle, P and Tang, L, *Anal. Chem.*, **1993**, 65(22), 972A

# MALDI: Matrix Assisted Laser Desorption Ionization

1. Sample is mixed with matrix (X) and dried on plate.
2. Laser flash ionizes matrix molecules.
3. Sample molecules (M) are ionized by proton transfer:  
 $\text{XH}^+ + \text{M} \rightarrow \text{MH}^+ + \text{X}$ .

# MALDI generation of ions

(Matrix-assisted laser desorption ionization)

**Sample mixed with a UV-absorbing matrix and is allowed to co-crystallize on the metal target.**

# Matrices for MALDI analysis

## Peptides/proteins

- 3,5-dimethoxy-4-hydroxycinnamic acid (sinapinic acid)
- $\alpha$ -cyano-4-hydroxycinnamic acid (CHCA)
- 2,5-dihydroxybenzoic acid (DHB)
- 2-(4-hydroxyphenylazo)-benzoic acid (HABA)

## Oligonucleotides

- 2-aminobenzoic acid
- 3-hydroxypicolinic acid (3-HPA)
- 2,4,6-trihydroxyacetophenone (THAP)

**The choice of matrix depends greatly on the solute to be analyzed.**

## Put it in

mass resolution and accuracy

# Mass Analyzer

## ***Mass analyzers separate ions based on their mass-to-charge ratio ( $m/z$ )***

- Operate under high vacuum  
(keeps ions from bumping into gas molecules)
- Actually measure mass-to-charge ratio of ions ( $m/z$ )

The importance of the mass-to-charge ratio is that according to classical electrodynamics two particles with the same mass-to-charge ratio move in the same path in a vacuum when subjected to the same electric and magnetic fields.

- $\mathbf{F} = m\mathbf{a}$  (Newton's second law of motion)
- $\mathbf{F} = q(\mathbf{E} + \mathbf{v} \times \mathbf{B})$  (Lorentz force Law)
- $(m/q)\mathbf{a} = \mathbf{E} + \mathbf{v} \times \mathbf{B}$
- Key specifications are resolution, mass measurement accuracy, and sensitivity.

# Time-of-flight (Tof) analyzer

## MALDI

Laser; High Energy  
Monochromatic Light Source

# Time-of-flight (TOF) Mass Analyzer

- Ions are formed in pulses.
- The drift region is field free.
- Measures the time for ions to reach the detector.
- Small ions reach the detector before large ones.

# Time-of-flight (Tof) analyzer

**Resolution  $2 \times 10^4$**

**No upper limit of mass**

**Scan times  $\sim 1 \mu\text{sec}$ , good for LC-MSMS**

Ions are accelerated so that they have equal kinetic energy. The ions “drift” down a 1 - 1.5 meter tube before striking a photomultiplier detector. “time of flight” ( $t$ ) depends on the mass of the ion ( $m$ ), where  $t = (m/2eV)^{1/2} \cdot D$

$V$  is the applied potential and  $D$  is the flight tube distance. For a given instrument, the flight time varies as the square root of the mass of the ion.

# Principals of the MALDI-Tof/Tof 4700

# QSTAR™ ESI QQ TOF or MALDI QQ TOF

# Quadrupole Mass Analyzer

Uses a combination of RF and DC voltages to operate as a mass filter.

- Has four parallel metal rods.
- Lets one mass pass through at a time.
- Can scan through all masses or sit at one fixed mass.

# Quadrupoles have variable ion transmission modes

**mass scanning mode**

**single mass transmission mode**

# Quadrupole mass filter / ion guide

**Octapole**

Hexapole, 9.5 mm Quadrupoles and 19 mm Quadrupoles

# Quadrupole analyzer

**Mass resolution  $2 \times 10^3$**

**Tolerant of relatively high pressure ( $10^{-4}$  torr)**

**Upper limit for  $m/z$  is 3,000-4,000**

Ions are accelerated electrically (5-15V) and passed along the long central axis of four rods arranged symmetrically.

By applying combined DC and oscillating RF potentials, the ions drift along irregular flight paths along the rod axis. The DC/RF ratio is held constant and the absolute values of DC and RF are varied.

Only ions with a particular  $m/z$  value have stable trajectories for a given value of DC and RF.

If DC is set to 0, then all ions have stable trajectories. *A scan can be accomplished over a period of 10-1000 msec.*

## QTRAP: Linear Ion Trap on a Triple Quadrupole

# Ion Traps

The ion trap is an energy well - ions with sufficient energy to enter the trap are retained by an energy barrier on the exit side of the trap. The advantage of the ion trap is that it accumulates selected ions prior to their analysis giving it high initial sensitivity (detection limit of approx. 20 fmol).

Ions are fragmented by collision with helium gas and their daughter ions analyzed within the trap. Selected daughter ions can undergo further fragmentation, thus allowing  $MS^n$ .

The ion trap has a high efficiency of transfer of fragment ions to the next stage of fragmentation (unlike the triple quadrupole instrument).

## Your machine

- Tof, Tof / Tof
- Quadrupole, Ion trap
- FT-ICR, Orbitrap (high resolution)
- Hybrids

## Tell me the RIGHT answer

- How right is it?

mass resolution and accuracy

## How is mass defined?

Assigning numerical value to the intrinsic property of “mass” is based on using carbon-12,  $^{12}\text{C}$ , as a reference point.

One unit of mass is defined as a Dalton (Da).

One Dalton is defined as 1/12 the mass of a single carbon-12 atom.

Thus, one  $^{12}\text{C}$  atom has a mass of 12.0000 Da.

# *Isotopes*

## **+Most elements have more than one stable isotope.**

For example, most carbon atoms have a mass of 12 Da, but in nature, 1.1% of C atoms have an extra neutron, making their mass 13 Da.

---

## **+Why do we care?**

Mass spectrometers can “see” isotope peaks if their resolution is high enough.

If an MS instrument has resolution high enough to resolve these isotopes, better mass accuracy is achieved.

## ***Stable isotopes of most abundant elements of peptides***

<b>Element</b>	<b>Mass</b>	<b>Abundance</b>
H	1.0078	99.985%
	2.0141	0.015
C	12.0000	98.89
	13.0034	1.11
N	14.0031	99.64
	15.0001	0.36
O	15.9949	99.76
	16.9991	0.04
	17.9992	0.20

## Mass spectrum of peptide with 94 C-atoms (19 amino acid residues)

“Monoisotopic mass”

## Isotope pattern for a larger peptide (207 C-atoms)

# Mass spectrum of insulin

Insulin has 257 C-atoms. Above this mass, the monoisotopic peak is too small to be very useful, and the average mass is usually used.

# Monoisotopic mass

When the isotopes are clearly resolved the **monoisotopic mass** is used as it is the most accurate measurement.

# Average mass

When the isotopes are not resolved, the centroid of the envelope corresponds to the weighted average of all the the isotope peaks in the cluster, which is the same as the average or chemical mass.

## What if the resolution is not so good?

At lower resolution, the mass measured is the average mass.

# How is mass resolution calculated?

**M**

100

$$R = M/\Delta M$$

**FWHM =  $\Delta M$**
